WHAT IS CLAIMED IS:

1. A printing control apparatus for performing printing by a printing device based upon a print job, comprising:

setting means for setting identification information corresponding to the print job; and

modifying means for enabling modification of at least one of a user name and document name of the print job to which the identification information set by said setting means has been appended.

2. The apparatus according to claim 1, wherein said printing device includes:

input means for inputting identification information; and

determination means for determining whether the identification information that has been input by said input means matches identification information corresponding to a received job;

wherein if a match is determined by said determination means, the print job corresponding to said identification information is executed.

3. A printing control method for performing printing by a printing device based upon a print job, comprising:

a setting step of setting identification information corresponding to the print job; and

a modifying step of modifying at least one of a

user name and document name of the print job to which
the identification information set in said setting step
has been appended.

5   4.   The method according to claim 3, wherein said
printing device executes:

an input step of inputting identification
information; and

a determination step of determining whether the
10 identification information that has been input in said
input step matches identification information
corresponding to a received job;

wherein if a match is determined in said
determination step, the print job corresponding to said
15 identification information is executed.

5.   A printing system having a host computer for
creating a print job, and a printing device for
performing printing upon receiving the print job from
20 the host computer, wherein said host computer has:

setting means for setting identification
information corresponding to the print job; and

modifying means for modifying at least one of a
user name and document name of the print job to which
25 the identification information set by said setting means
has been appended;

and said printing device including:

input means for inputting identification
information; and

determination means for determining whether the
identification information that has been input by said
input means matches identification information
corresponding to a received job;

wherein if a match is determined by said
determination means, the print job corresponding to said
identification information is executed.

6. The system according to claim 5, wherein said
printing device further comprising:

display means for displaying at least one of a
document name and user name appended to a print job
received from said host computer; and

designating means which, if information relating to
multiple print jobs is being displayed on said display
means, is for designating a print job, for which
printing is to be executed, from among the multiple
print jobs.

7. A printing control method in a printing system
having a host computer for creating a print job, and a
printing device for performing printing upon receiving
the print job from the host computer, said method
comprising:

a setting step of setting identification

information corresponding to the print job;

a modifying step of modifying of at least one of a
user name and document name of the print job to which
the identification information set in said setting step
has been appended;

a step of transmitting the print job to said
printing device;

a determination step of inputting identification
information and determining whether this identification
information matches identification information
corresponding to a received job; and

a step of executing the print job corresponding to
said identification information if a match is determined
at said determination step.

8.   The method according to claim 7, further comprising:
a display step of displaying at least one of a
document name and user name appended to a print job
received from said host computer; and

a designating step which, if information relating
to multiple print jobs is being displayed at said
display step, is a step of designating a print job, for
which printing is to be executed, from among the
multiple print jobs.

9.   A computer-readable storage medium storing a program
for implementing a printing control method for

performing printing by a printing device based upon a print job, comprising:

a module of a setting step of setting identification information corresponding to the print job; and

a module of a modifying step of modifying at least one of a user name and document name of the print job to which the identification information set by said module of the setting step has been appended.

10. A computer-readable storage medium storing a program for implementing a printing control method in a printing system having a host computer for creating a print job, and a printing device for performing printing upon receiving the print job from the host computer, comprising:

a module of a setting step of setting identification information corresponding to the print job;

a module of a modifying step of modifying at least one of a user name and document name of the print job to which the identification information set by said module of the setting step has been appended;

a module of a step of transmitting the print job to said printing device;

a module of a determination step of inputting identification information and determining whether this

identification information matches identification
information corresponding to a received job; and

    a module of a step of executing the print job
corresponding to said identification information if a

5   match is determined by said module of the determination
step.

11. The storage medium according to claim 10, further
comprising:

10   a module of a display step of displaying at least
one of a document name and user name appended to a print
job received from said host computer; and

    a module of a designating step which, if
information relating to multiple print jobs is being

15 displayed by said module of the display step, is a
module of a step of designating a print job, for which
printing is to be executed, from among the multiple
print jobs.
